1 70mai Dashcam Auto-Backup to SFTP (Android)

"" "[70mai](https://img.shields.io/badge/Dashcam-70mai-orange.svg)"

A professional Android application designed for 70mai dashcam reverse engineering and automatic file synchronization. It transfers videos and photos from 70mai dash cameras to a private SFTP storage via a secure Wi-Fi handshake.

1.0.1 Optimized for Search Engines (SEO Keywords)

70mai dashcam backup, 70mai protocol reverse engineering, 70mai A500S video transfer, 70mai A800S Android app, auto dashcam sync SFTP, dashcam to cloud backup, 70mai Wi-Fi protocol, com.lz1bgb.camhttp.

1.1 Key Features

- Hybrid Networking: Automatically binds HTTP requests to the dashcam's Wi-Fi network (192.168.0.1) even when mobile data is active. This allows the app to talk to the camera and the internet (SFTP) simultaneously.
- 70mai Protocol Implementation: Full implementation of the reverse-engineered 70mai handshake:
 1. BindByBanya: Initial pairing request.
 2. UserconfirmByBanya: Waiting for physical button press on the dashcam.
 3. client.cgi: Session registration and keep-alive.
- Data Integrity:
 - Downloads files using a prioritized queue (oldest first).
 - Verifies file existence and size on the phone before sending the delete command to the camera.
 - Skips the most recent files (last 3 minutes) to ensure they are fully finalized by the camera.
- Background Operation: Runs as a foreground service with a persistent notification, ensuring Android doesn't kill the process during long transfers.
- Statistics & Monitoring: Real-time tracking of remaining files, download duration, and transfer status.

1.2 Technical Implementation

1.2.1 Networking

The app uses OkHttpClient with custom SocketFactory binding. When a target URL contains 192.168.0.1, the app forces the traffic through the Wi-Fi interface, bypassing the system's default route (which usually prefers mobile data when Wi-Fi has no internet).

1.2.2 File Management

1. Camera Stage: Scans all CGI types (0-15). Filters out files currently being recorded. Downloads via HTTP.
2. Local Stage: Files are stored in /Android/data/com.lz1bgb.camhttp/files/camera/ preserving the original directory structure (e.g., /Normal/Front/).
3. Archive Stage: If the camera is not in range, the app automatically switches to SFTP mode and uploads the local files to the configured server, deleting them locally upon success.

1.3 Licensing

This project is subject to a Dual License model:

1.3.1 1. Non-Commercial Use

For personal, educational, or non-profit use, this software is licensed under the GNU General Public License v3.0 (GPLv3). See the LICENSE file for details.

1.3.2 2. Commercial Use

Any use within a commercial entity, for-profit project, or redistribution as part of a paid product requires a separate Commercial License.

- You must obtain written consent from the author.
